

NAME

`pwd` – print name of current/working directory (smart-link version)

SYNOPSIS

`pwd` [*OPTION*]...

DESCRIPTION

Print the full filename of the current working directory.

This version is a "reduced-friction" wrapper designed to identify symbolic link paths. If the logical path (where you think you are) differs from the physical path (where the disk says you are), it displays both joined by an arrow.

THE SCRIPT

This manual entry documents the following intercept script:

```
#!/bin/bash
DASHLPATH=$(pwd -L)
DASHPPATH=$(pwd -P)
if [[ $DASHLPATH != $DASHPPATH ]]; then
  echo $DASHLPATH "=>" $DASHPPATH
else
  /bin/pwd
fi
```

INSTALLATION

To replace the system default with this smart version, add the following to your **.bashrc** or **.functions** file:

```
alias pwd=''/path/to/your/script/pwd'
```

NOTES

If no symbolic link is detected, the script transparently executes the standard system **/bin/pwd**.
