

NAME

mkdir – make directories with automatic creation of intermediate directories.

SYNOPSIS

mkdir */directory/path/as/desired*

DESCRIPTION

This ‘zsh’ function creates a directory, including any non-existent intermediate directories included in the supplied pathname. If the intermediate directories already exist, they are unchanged.

THE SCRIPT

This manual entry documents the following ‘.zshrc’ function:

```
mkdir() {  
    # We inject -p right at the start.  
    # Any subsequent flags passed by the user (like -m 755) will override or complement it.  
    command mkdir -p "$@"  
}
```
